|         | Syntax                                               | Description                                                                                                                                                                                                                                                                                        |
|---------|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| polyval | $y = \text{polyval}(p,x)$                            | evaluates the polynomial $p$ at each point in $x$ . The argument $p$ is a vector of length $n+1$ whose elements are the coefficients (in descending powers) of an $n$ th-degree polynomial.                                                                                                        |
|         | $[y,\text{delta}] = \text{polyval}(p,x,S)$           | uses the optional output structure $S$ produced by <code>polyfit</code> to generate error estimates. $\text{delta}$ is an estimate of the standard error in predicting a future observation at $x$ by $p(x)$ .                                                                                     |
|         | $y = \text{polyval}(p,x,[],\text{mu})$               | use the optional output $\text{mu}$ produced by <code>polyfit</code> to center and scale the data. $\text{mu}(1)$ is <code>mean(x)</code> , and $\text{mu}(2)$ is <code>std(x)</code> . Using these values, <code>polyval</code> centers $x$ at zero and scales it to have unit standard deviation |
|         | $[y,\text{delta}] = \text{polyval}(p,x,S,\text{mu})$ |                                                                                                                                                                                                                                                                                                    |

```

1 - p = [5 6 -1];
